UC Riverside's Bourns College of Engineering-Center for Environmental Research and Technology (CE-CERT) has unique capabilities to test a variety of electric drive vehicles, including pure battery electric, fuel-cell, hybrid electric, and plug-in hybrid electric vehicles. With two state-of-the-art chassis dynamometers, both light-duty and heavy-duty EVs can be tested. CE-CERT has developed a wide range of electric drive testing protocols, providing research results to industry, government agencies, and academia.

Electric Drive Vehicle Testing Laboratories

UC Riverside

Dynamometer Systems capable of testing a wide range of electric-drive vehicles

CE-CERT's dynamometers have been designed to handle a range of vehicles and vehicle loads at on-road driving conditions. The Heavy-Duty 48" Electric AC Chassis Dynamometer has dual, direct connected, 300 horsepower motors attached to each roll set with a base inertia of 45,000 lbs. with the addition of a large flywheel. The dynamometer applies appropriate loads to a vehicle to simulate factors such as the friction of the roadway and wind resistance that it would experience under typical driving. A driver accelerates and decelerates following a driving trace while the vehicle is driven in place.

Working with CARB and the California Energy Commission, CE-CERT has developed and utilizes specific testing protocols for EVs

In addition to standard vehicle performance measurements of velocity and acceleration, CE-CERT is able to measure battery SOC, system voltage and current, energy efficiency per mile (kWh/mile) and gradeability.

Electric Vehicle Drive Cycle Testing

Through extensive vehicle activity studies, CE-CERT has developed a number of "drive cycles" specific for electric vehicles and trucks. These drive cycles, in addition to certification drive cycles can be tested repeatedly in a controlled environment.

Electric Drive Vehicle Testing Laboratories

UC Riverside

Technology Type	Testing Capabilities
Heavy Duty Chassis Dynamometer	Capable of testing any electric truck in a wide range of configurations
Light Duty Chassis Dynamometer	Capable of testing any light-duty electric vehicle in a wide range of configurations
EV Data Acquisition System: Real-Time Monitoring System Software and Sensors	Capable of measuring dynamometer physical loads, battery SOC, vehicle voltage, current, energy efficiency

SIGI: Sustainable Integrated Grid Initiative

UC Riverside

UCR has well established microgrid testbeds and laboratories for pre-commercial testing of new technologies in a “living lab” environment. Over the last six years, UCR researchers have designed and implemented numerous microgrid systems including 2.2 MWh of battery energy storage, over 11 MW solar PV, 8 MW of Thermal Energy Storage (TES) for chiller operations, and multiple electric vehicle chargers including supervisory control and data acquisition systems.

These unique microgrid/smartgrid testbeds with plug and play capabilities possess the ability to validate various Hardware in Loop (HiL) scenarios. In addition to energy system modeling, UCR can utilize its microgrid testbed for evaluating specific microgrid designs that will be placed elsewhere.

Sustainable Integrated Grid Initiative Testbed

UC Riverside

Battery Storage

- 2 MWh integrated battery energy storage
- Stationary and mobile battery platforms
- 10 MW of controllable loads
- Load shifting and peak shaving algorithm optimization
- Demand response

Renewable Energy Generation

- 8 MW of PV solar capacity islanding operation and control
- Curtailment optimization & Soiling evaluation
- Fixed vs. tracking characterization
- Zero net energy microgrid demonstration with storage and load control integration

System Integration

- SCADA microgrid controller development
- Power quality monitoring and analysis with load monitoring and control
- Microgrid optimization
- EV charging with microgrid integration
- Anomaly detection and response

Sustainable Integrated Grid Initiative Testbed

UC Riverside

Technology Type	Testing Capabilities
Solar Panels	Soiling, efficiency, curtailment, performance, microgrid integration, islanding
Inverters	Efficiency testing (5kW to MW+), curtailment, islanding, voltage support, reactive power control, grid ancillary services
Battery Energy Storage	Microgrid integration, control optimization, Battery Management System (BMS), performance, islanding
Microgrid Control and Integration	System architecture, net zero configuration, controls, distributed generation, load management
Load Management	SCADA, islanding, microgrid integration, control optimization, energy profiling
Supervisory Control and Data Acquisition (SCADA)	System optimization, system configuration, energy measurement, load management, performance monitoring
Vehicle to Grid	As of 2019, SIGI now offers testing of vehicle-to-grid algorithms using the latest V2G inverter systems.

Shared, Electric, Connected, and Automated Vehicle Testing

UC Riverside

When considering how to get to zero-carbon mobility, there are generally four strategies to consider: 1) build more efficient vehicles that emit less carbon (e.g., HEVs, BEVs, and fuel-cell EVs); 2) utilize low- or zero-carbon fuel such as electricity or hydrogen; 3) implement programs that reduce overall VMT; and 4) employ ITS and automation technology to improve transportation system efficiency. UC Riverside has set up testbeds to evaluate Shared Mobility (addressing strategy 3), Transportation Electrification (addressing strategies 1 & 2), and Connected and Automated Vehicles (addressing strategy 4).

A key vehicle testbed, the *Innovation Corridor*, located in Riverside, California, consists of a six-mile section of University Avenue between the main UCR campus and downtown Riverside. This arterial corridor has been outfitted with traffic signal controllers that broadcast signal phase and timing, employ video analytics, and is used for experimentation with shared, electric, connected and automated vehicle (e.g., cars, buses, and trucks).

Shared, Electric, Connected, and Automated Vehicle Testing

UC Riverside

Innovation Corridor

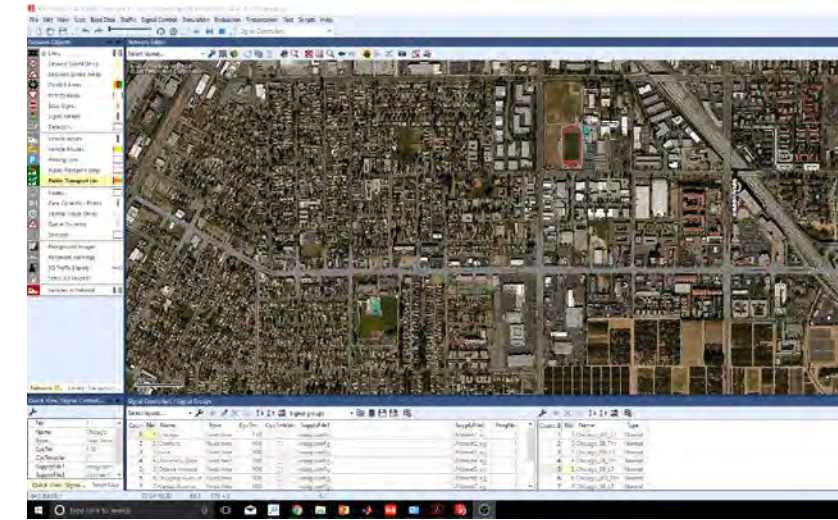

Consists of 10 instrumented intersections along a 4 lane urban arterial. Intersections utilize modern traffic signal controllers that broadcast signal phase and timing and employ video analytics

Example connected vehicle application

The corridor is used to conduct Eco-approach and departure studies at signalized intersections. Vehicles can “listen” to an upcoming signal’s phase and timing and adjust their speed to reduce energy consumption and improve throughput.

Demo at: <https://youtu.be/j9Tg2g9YTjc>

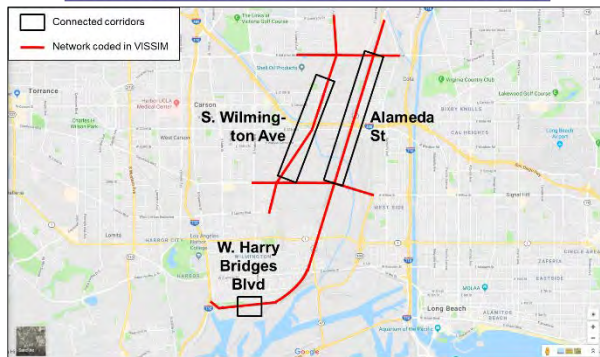

Simulation and testing platforms

Complementing real world testing, modeling enables the projection of mobility and environmental benefits from the wide-scale adoption of shared, electric, connected and automated vehicle technologies.

Shared, Electric, Connected, and Automated Vehicle Testing (for Trucks)

UC Riverside

Southern California CAV Testbed

Alameda St

- 3-mile segment
 - 2-3 lanes per direction
 - 45 mph speed limit
- 6 traffic signals
 - 5 connected
 - Actuated signal control

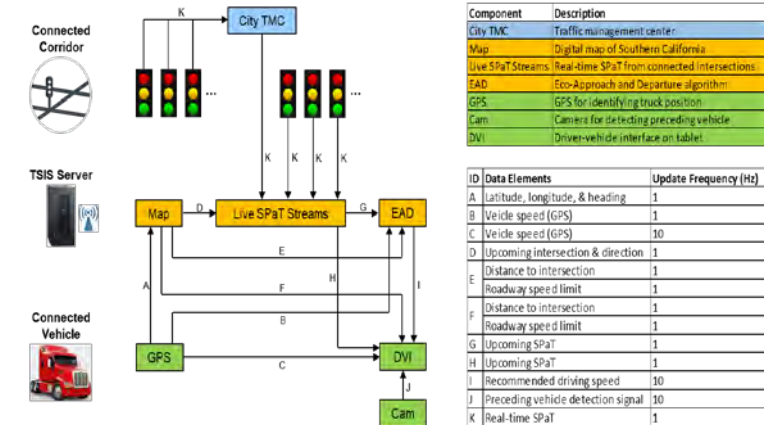

W. Harry Bridges Blvd

- 0.5-mile segment
 - 2 lanes per direction
 - 35-40 mph speed limit
- 5 traffic signals
 - 5 connected
 - Fixed-time signal control

S. Wilmington Ave

- 2-mile segment
 - 2 lanes per direction
 - 40 mph speed limit
- 9 traffic signals
 - 5 connected
 - Actuated signal control

Traffic Signal Information System (TSIS)

The connectivity of these connected traffic signals is enabled by 4G/LTE cellular communication where real-time signal phase and timing (SPaT) information is sent to the Traffic Signal Information System (TSIS) server at UCR. Vehicles traveling on the testbed can request and receive the SPaT information from the TSIS server through the same cellular communication. Currently, the testbed is being used to test and evaluate an EAD application for heavy-duty trucks, developed by UCR.

Los Angeles Testbed

UCR has set up three arterial corridors with 15 connected traffic signals nearby the port of Los Angeles to support a variety of connected truck applications such as Eco-Approach and Departure, freight signal priority.

Shared, Electric, Connected, and Automated Vehicle Testing

UC Riverside

Technology Type	Testing Capabilities
Shared Mobility Evaluation	Using LBNL's BEAM model, travel demand activity can be evaluated for a number of shared mobility scenarios, measuring a variety of performance metrics
Evaluating Connected and Automated Vehicles (CAVs) in Simulation	Using a wide range of simulation tools (e.g., VISSIM, PARAMICS, SUMO) and specific APIs, a wide range of CAV scenarios can be tested
Evaluating Connected and Automated Vehicles (CAVs) using Hardware in the Loop testing	A unique hardware-in-the-loop testing system for CAVs has been developed, combining traffic simulation and a real-world vehicle on a dynamometer
Evaluating Connected and Automated Vehicles (CAVs) on the road	UCR has developed several CAV testbed sites in Riverside California, and Carson California, installing communication infrastructure on the road

Electrical Motor Systems Testing Laboratory

UC Riverside

This testing facility, developed with California Energy Commission (CEC) funding, is capable of efficiency and load testing of electric motors and Adjustable Speed Drive (ASD) up to 100hp. The facility can also measure electric system harmonics.

This is the first independent electric motor testing center in the state of California capable of providing unbiased evaluation of motor efficiency at various operating conditions. This facility is available for the use by the industry professionals, academics, and other stake holders.

Electrical Motor Systems Testing Laboratory

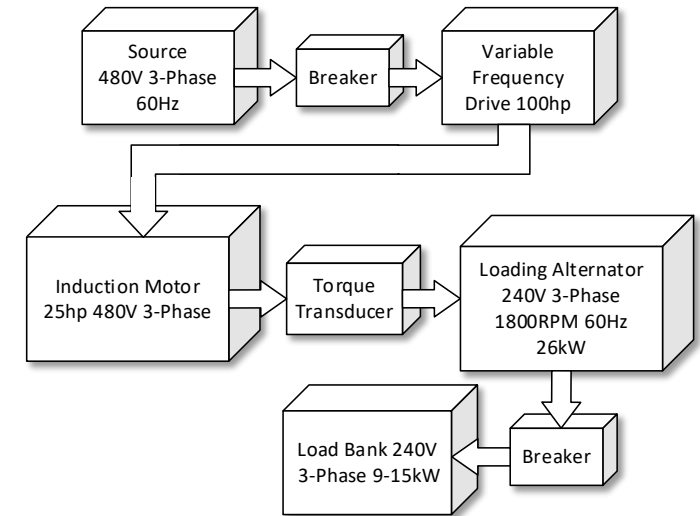

UC Riverside

Motor Efficiency Measurement & Verification

Output power is monitored and measured using the torque transducer, which separates the load from the motor to isolate output measurement at the shaft of the motor.

External portable Fluke Power Analyzers enable the accurate measurement of both input and output power necessary to find operational efficiency of a motor. This used to verify efficiency of an electric motor.

Improving Software for Efficient Motor Selection

- Many commercial and in-house software used by architectural and engineering firms design HVAC systems with inflated safety factors used in calculating three-phase motor sizes for buildings
- UCR quantifies energy waste due to the: (i) use of lower efficiency motors, (ii) use of oversized motors in existing buildings, and (iii) selection of oversized motors in the architectural and engineering design stage of new buildings.

Electrical Motor Systems Testing Laboratory

UC Riverside

Technology Type	Testing Capabilities
Industrial Electric Motors	Zero to Rated Torque, Efficiency at Various Loading Condition, Quantification of Voltage and Current Harmonics, Range 0-100hp
Variable Frequency Drives	Efficiency at Various Loading Condition, Quantification of Voltage and Current Harmonics, Range 0-100hp
Wind Generators	Zero to Rated Torque, Efficiency at Various Loading Condition, Quantification of Voltage and Current Harmonics, Range 0-100hp
Custom Designed Special Purpose Electric Motors	Zero to Rated Torque, Efficiency at Various Loading Condition, Quantification of Voltage and Current Harmonics, Range 0-100hp

Vehicle to Grid (V2G)

Vehicle to Grid (V2G) architectures allow grid connected vehicles to transfer power from the vehicle back to the electric supply infrastructure. The optimization of V2G requires properly configured vehicles and electric vehicle supply equipment (EVSE).

UC Riverside has created a microgrid testbed with integrated V2G capabilities. The system utilizes both light duty passenger EVs and larger transit vehicles.

Research is focused on system architectures, controls, optimization, energy management, and communications.

Shown in Picture: Electric Vehicle supplying power to the storage bank (inside trailer) which is connected to the building microgrid

Vehicle to Grid (V2G)

UC Riverside

Diesel to Electric Conversions

- Equipped for bi-directional energy transfer
- Light duty and transit vehicle platforms
- 100 kW V2G capability
- Load shifting and peak shaving algorithm optimization
- Demand response

Battery Energy Storage with V2G Integration

- Load management utilizing V2G algorithms
- Smart charging based on distributed generation
- Aggregation algorithm development
- Vehicle activity monitoring
- Carbon based pricing for EV charging

EV charging Monitoring and Control

- Peak shaving and shifting
- Energy cost optimization
- Zero net energy algorithm development
- Utility integrated demand response

Vehicle to Grid (V2G)

UC Riverside

Technology Type	Testing Capabilities
Electric Vehicle Supply Equipment (EVSE)	V2G capability, performance, measurement, access control, billing, communications
V2G capabilities	Energy measurement, capacity, vehicle connectivity, protocols
Microgrid Control and Integration	System architecture, net zero configuration, controls, load management
Load Management	SCADA, islanding, microgrid integration, control optimization, energy profiling
Vehicle Activity	Energy profiles, trip activity, charging activity, GIS based analysis, vehicle energy monitoring

About 20% of electricity use in California is treating, pumping, and distribution of water. With funding from California Energy Commission (CEC), College of Engineering – Center for Environmental Research and Technology (CE-CERT) at the University of California, Riverside (UCR) has demonstrated and deployed an energy management and data acquisition and supervisory control strategies that reduce peak loads and electricity costs in the delivery and treatment of water at each of the three water district locations. The three deployments utilize existing on-site SCADA architecture and implement the Energy Management System (EMS) within the existing architecture.

This demonstration project highlights a pathway for water agencies in California to reduce their peak energy consumption substantially with no decrement in service or reliability. The project also identifies “real world” implementation issues that have not emerged in previous proof-of-concept research.

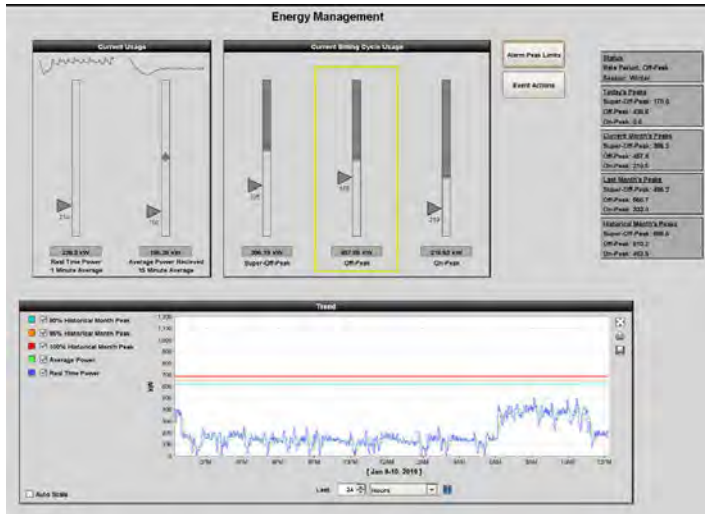

OPTO 22

Water Energy Nexus

UC Riverside

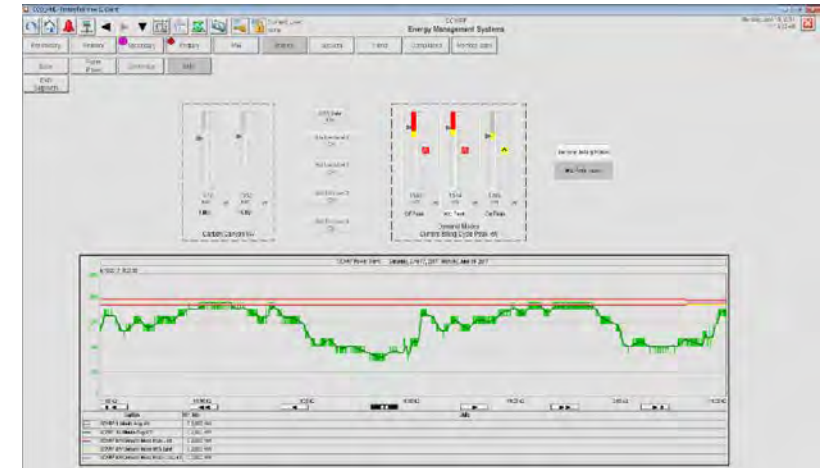

Water Delivery Optimization

Integration of software and hardware at water delivery pumping, storage, or treatment facilities that enable the integration and transmission of data from energy meters directly or indirectly into Supervisory Control and Data Acquisition (SCADA).

Reducing Peak Energy Consumption

- This demonstration project highlights a pathway for water agencies in California to reduce their peak energy consumption substantially with no decrement in service or reliability.
- The project also identifies “real world” implementation issues that have not emerged in previous proof-of-concept research.

Individual SCADA System Integration

- Combined with historical energy use integrated with real time SCADA control displays, operators can manage systems in real time to monitor and control peak demand.
- Real time energy usage monitoring provides both instantaneous and 15min average relative to Time of Use (TOU) rate schedules, and alarm notifications optimized to provide operators with real time energy demand and the current existing peak load that has been recorded to date.

Water Energy Nexus

UC Riverside

Technology Type	Testing Capabilities
Energy Management System (EMS)	Customized Development and Validation
Supervisory Control and Data Acquisition (SCADA)	Customized Development and Validation
Real-Time Monitoring System Software and Sensors	Development, Testing, and Validation
